

EGS System

This system's washing efficiency has exceeded the working efficiency of the normal washing system. The drying efficiency has exceeded the working efficiency of the normal washing system with dryer, and the energy consumption is lower. The whole line has to stop working for maintenance when the washing machine or dryer of the normal washing system breaks down, which would seriously affect production. And the maintenance cost is higher, the previous investment cost is larger. **The EGS integrated laundry system** is made up of single machines with the maximum work efficiency. The other equipment can normally work while the single machine is out of order, which wouldn't affect normal production. The cost of single machine maintenance is low and the previous cost of the entire integrated system is lower which is less than the half cost of the general tunnel-type integrated system. **It can save more than 60% investment.**
